

## **Non-Op Talk Track**

We highly recommend Robotic Laser Therapy for patients for whom surgery is not an option. Laser therapy is very effective, recommended by the American Academy of Orthopedic Surgeons and FDA cleared.

Laser works by emitting the energy of light into the damaged cell which stimulates intracellular activity, reduces pain and inflammation, and accelerates recovery time.

I offer this option to my non-surgical patients because laser treatment is effective, non-invasive and helps people feel better faster. We use the MLS M8 Robotic Laser because it's the most advanced laser available. Treatment is painless and lasts an average of 10 minutes. Acute injuries require 6 treatments while more chronic conditions require 12.

I have provided you additional information as well as a contact for you to ask any additional questions and to schedule your first appointment. Check out our website for more detail and patient reviews!
