

## **Post- Op Talk Track**

Following your surgery, we highly recommend Robotic Laser Therapy to accelerate your healing. Using laser therapy after surgery can significantly decrease wound healing time, the need for pain medication and recovery time.

Laser treatment is a painless procedure that is performed in an outpatient setting. Laser treatments are FDA cleared and recommended by the American Academy of Orthopedic Surgeons. For post operative care we recommend 6 visits for maximal results. Laser therapy is very safe, and you will not hear, feel, or see it.

I strongly encourage you to consider laser treatment for optimal outcomes with post-surgical healing. I have some additional information you can take with you, as well as the contact information for setting up your first appointment. If you have additional questions, please contact XXXX or check out our website for more detail and patient testimonials!
